

We are seeking a skilled Linux/Driver Development Engineer to join our team in developing cutting-edge wireless communication systems. In this role, you will contribute to the development of new features, resolve bugs, and ensure the stability and performance of our embedded platform. You will work closely with cross-functional teams to enhance our product's functionality and reliability.

- Develop, enhance, and maintain Linux device drivers for wireless communication hardware
- Work on Linux kernel internals to optimize and customize the system for embedded use
- Debug and troubleshoot system-level issues, ensuring prompt resolution of bugs
- Collaborate with hardware, software, and QA teams to design, implement, and test new features
- Develop and maintain automation scripts using Python or Shell for system testing and validation
- Optimize performance at the kernel and driver level to meet system requirements
- Provide technical support during product integration and deployment

Requirements

- 2+ years of experience in embedded Linux development
- Strong knowledge of Linux internals and kernel module development. Understanding of kernel modules and driver development for hardware like PCIe, USB, I2C, SPI, or Ethernet devices
- Experience in developing or maintaining Linux hardware/network device drivers
- Proficient in C programming; C++ knowledge is a plus
- Solid debugging and troubleshooting skills using tools like gdb, strace, or perf
- Basic proficiency in Python or Shell scripting

- Familiarity with Git for version control

Preferred Qualifications:

- Experience in wireless communication protocols (e.g., Wi-Fi, LTE, 5G) is desirable
- Understanding of TCP/IP networking concepts
- Knowledge of embedded platforms and cross-compilation
- Experience with real-time debugging and crash analysis
- Exposure to CI/CD pipelines for build and test automation

Benefits

We offer great career growth, ESOPs, Gratuity, PF and Health Insurance.
